

Services_Extranets

We understand that running architectural projects can be daunting, with tight demands on time and budget. Having an extranet for your project can be a big help, streamlining communication and saving both time and money. Essentially, an extranet is a tool that operates like a private intranet for a group of users - like your project team, for example - and requires only a computer with an internet connection.

As an additional service, we design and build project extranets to help you run your project more effectively. Working in architecture ourselves means that our extranets have a unique focus derived from our understanding of managing architectural projects. Each extranet we build is as unique as the project itself: fully customised, our extranets are not a 'one size fits all' solution. We only install the tools that will ensure your job runs more smoothly and facilitates close control of project costs.
